Outline

1. Protocol description: how we calculate the binding free energy?
2. Comparison of results of datasets
3. SAMPLing results

Software for the simulations

- SOMD: alchemical free energy calculation engine

Model A: binding free energy

Switching off charges

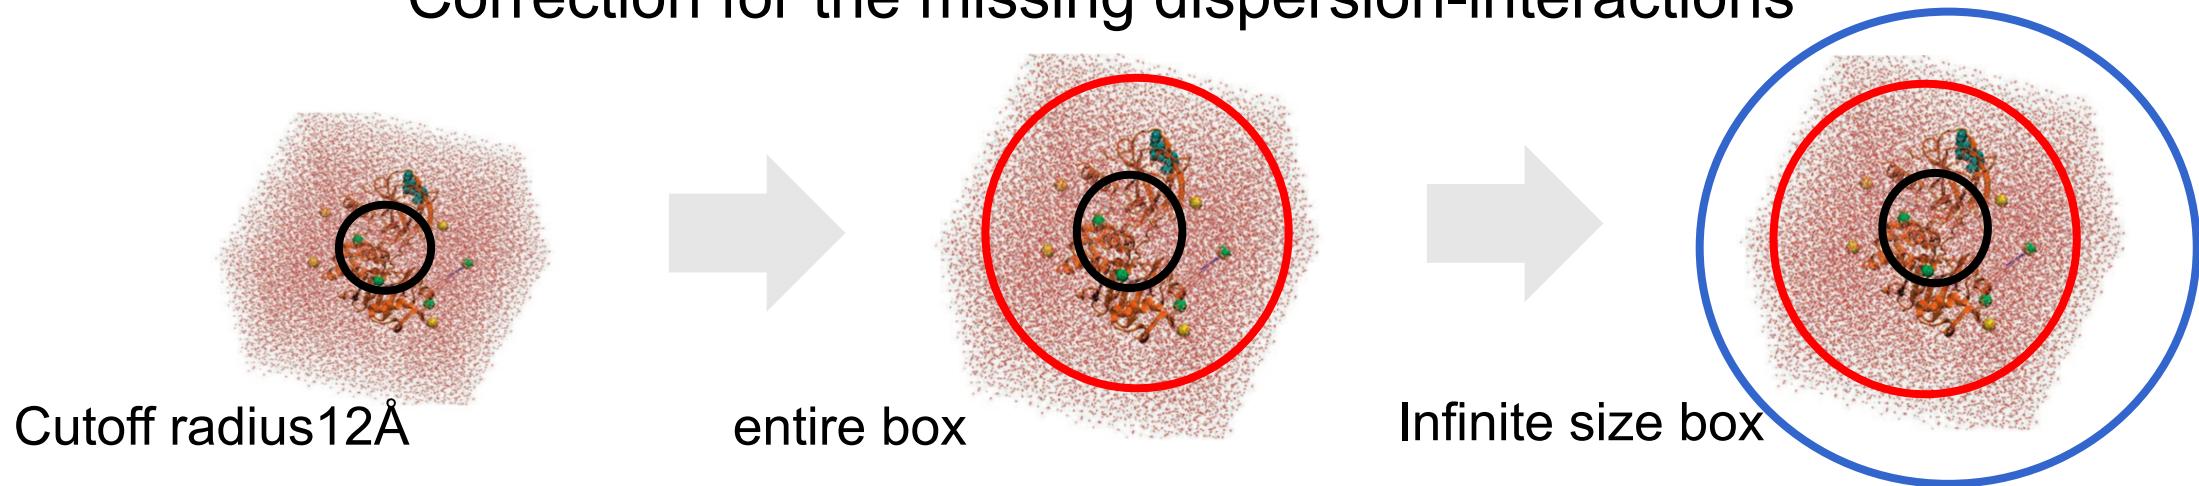

$$\Delta G_{bind} = (\Delta G_{elec}^{solv} + \Delta G_{vdW}^{solv}) - (\Delta G_{elec}^{host} + \Delta G_{vdW}^{host})$$

Alchemical intermediate states ($0 < \lambda < 1$)

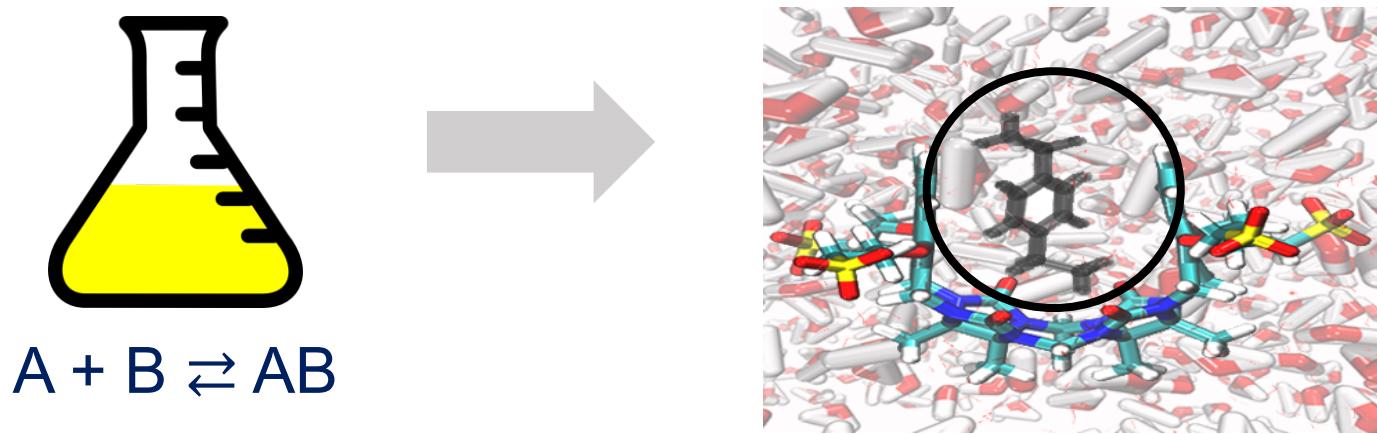

Model C: Long Range Correction + Standard State

Correction for the missing dispersion-interactions

Free energy cost for imposing a restraint – Standard State correction

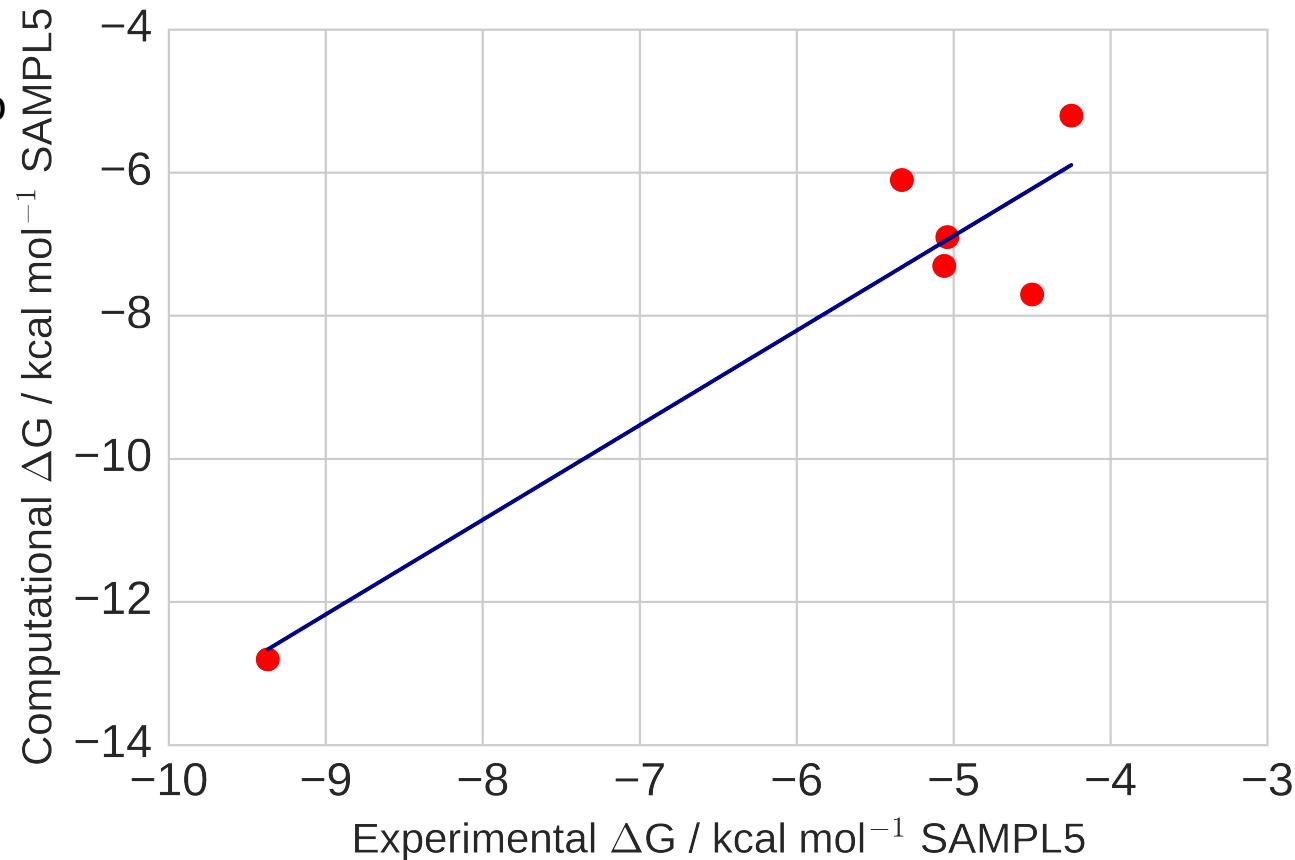

Model D: Model C + Empirical Estimation

Linear regression from the comparison of the experimental results $\Delta G_{experimental}^{\circ}$ and our computational results $\Delta G_{computational}^{\circ}$ in SAMPL5.

$$\Delta G_{computational\ SAMPL5}^{\circ} = a \Delta G_{experimental\ SAMPL5}^{\circ} + b$$

$$\Delta G_{mod\ C}^{\circ} = a \Delta G_{mod\ D}^{\circ} + b$$

$$\Delta G_{mod\ D}^{\circ} = \frac{\Delta G_{mod\ C}^{\circ} - b}{a}$$

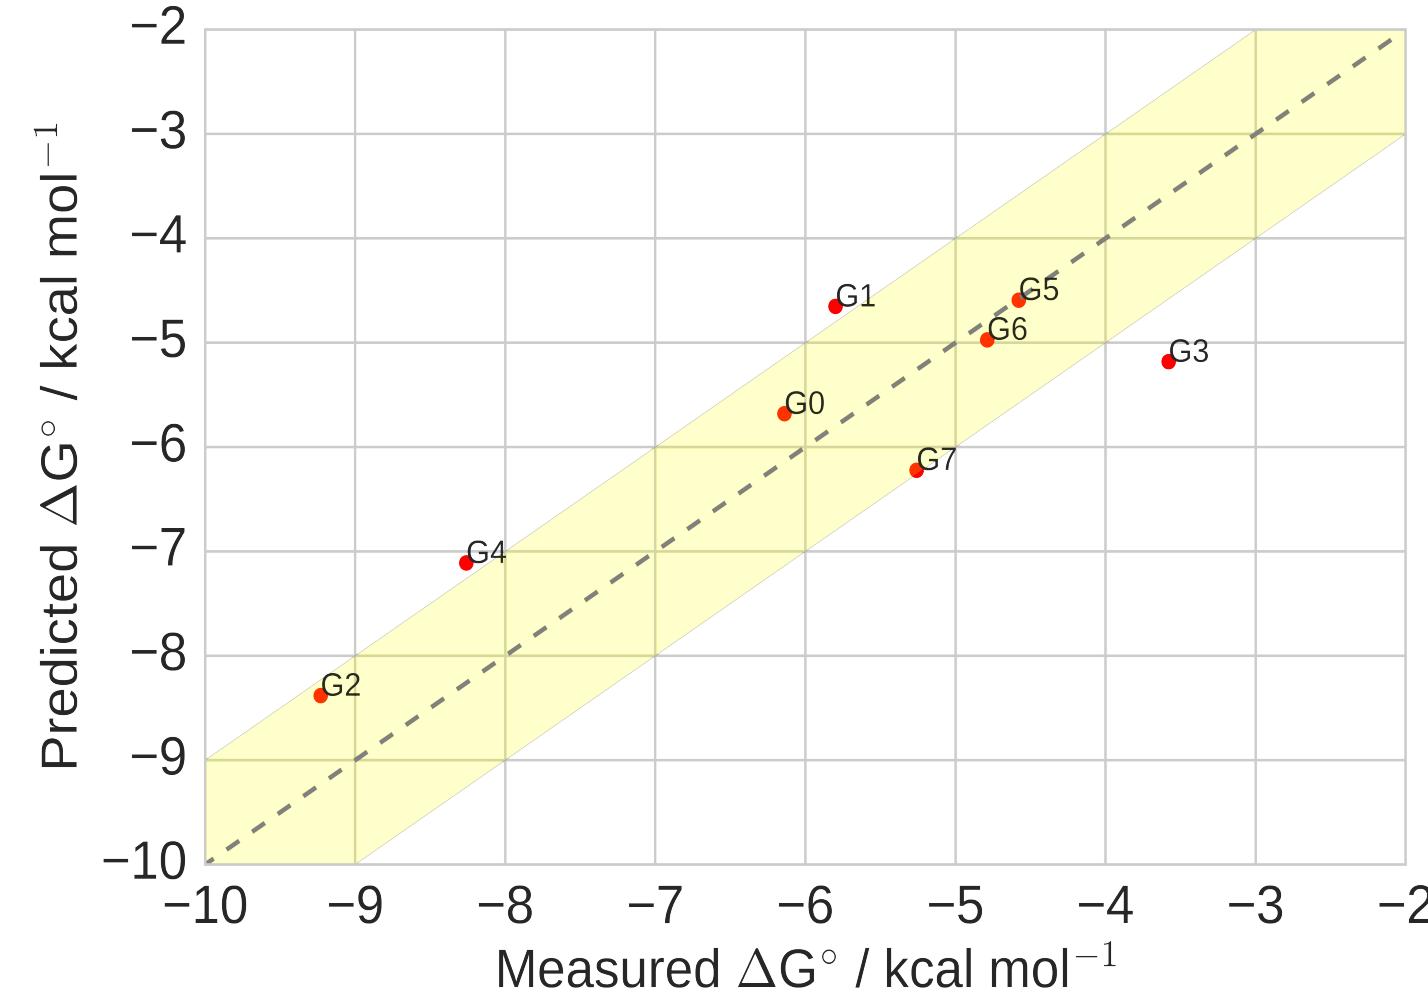

Modelling the buffer

- ❖ Three models submitted for the calculation of the free energy of binding:
 1. **Model A** = Binding Free Energy
 2. **Model C** = Model A + Lennard Jones correction term + Standard state correction term
 3. **Model D** = Model C + Empirical estimation of binding free energy

- ❖ Two sets of simulation:
 - I. **No buffer**: Ions to neutralize the overall charge of the box
 - II. **Buffer**: NaCl to model the sodium phosphate buffer by replicating the ionic strength

Results of OA – Model D buffer

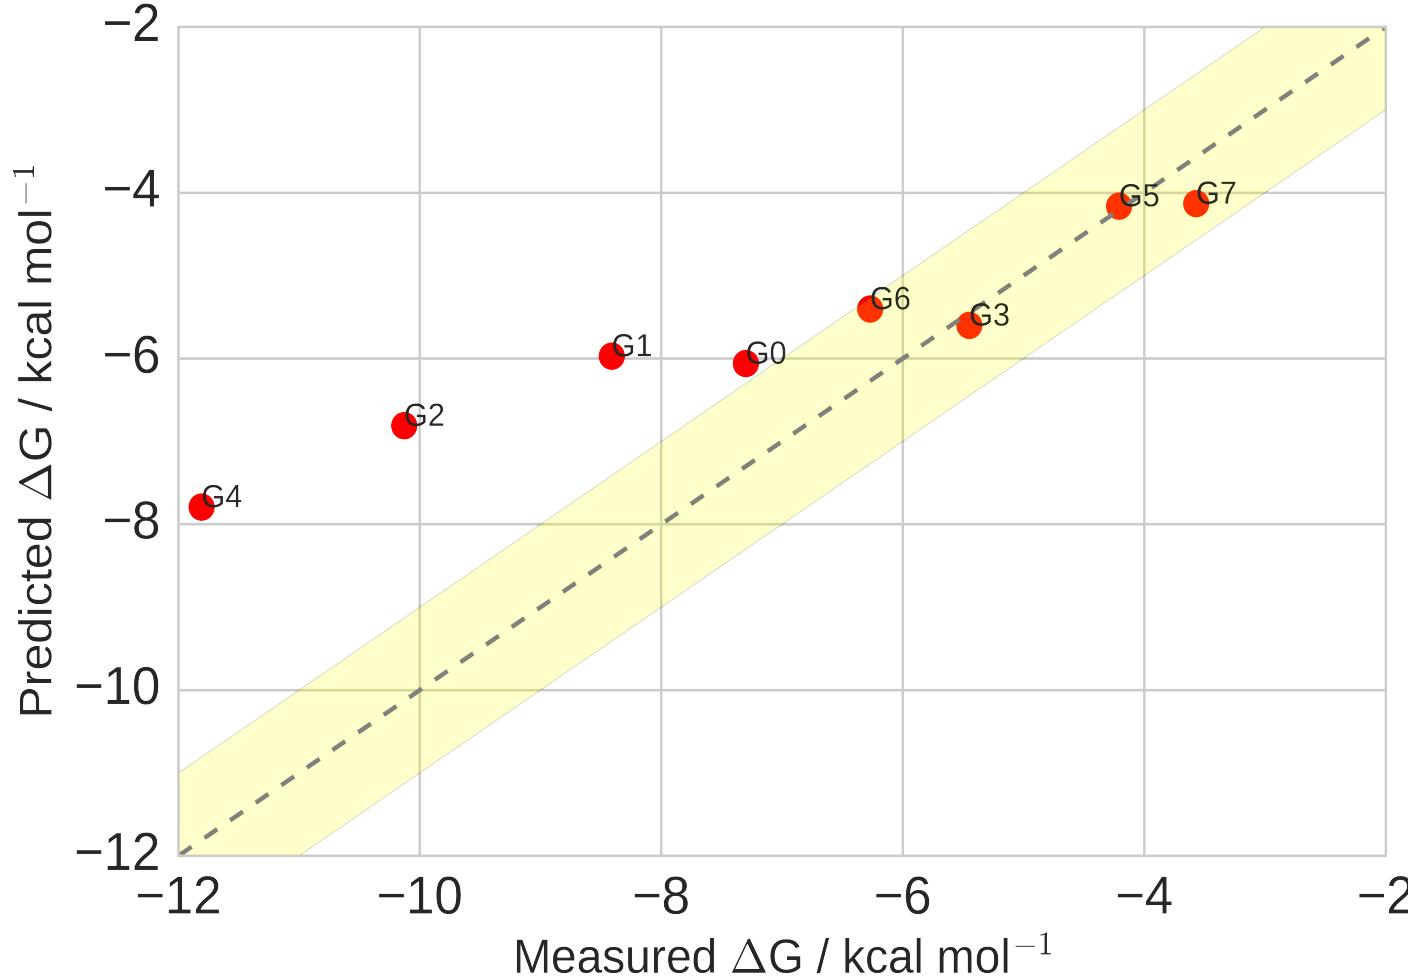

- Model D, **R²** : 0.62 < 0.74 < 0.84
MUE : 0.65 < 0.82 < 1.00 kcal/mol
Kendall tau : 0.43 < 0.54 < 0.64
- Model C, **R²** : 0.62 < 0.74 < 0.84
MUE: 2.15 < 2.37 < 2.60 kcal/mol
Kendall tau : 0.43 < 0.54 < 0.64
- Model A , **R²** : 0.63 < 0.75 < 0.85
MUE: 4.16 < 4.41 < 4.66 kcal/mol
Kendall tau : 0.43 < 0.55 < 0.64
- **Buffer** did not improve the results

Comparison buffer-nobuffer in OA host-guest systems

Model C

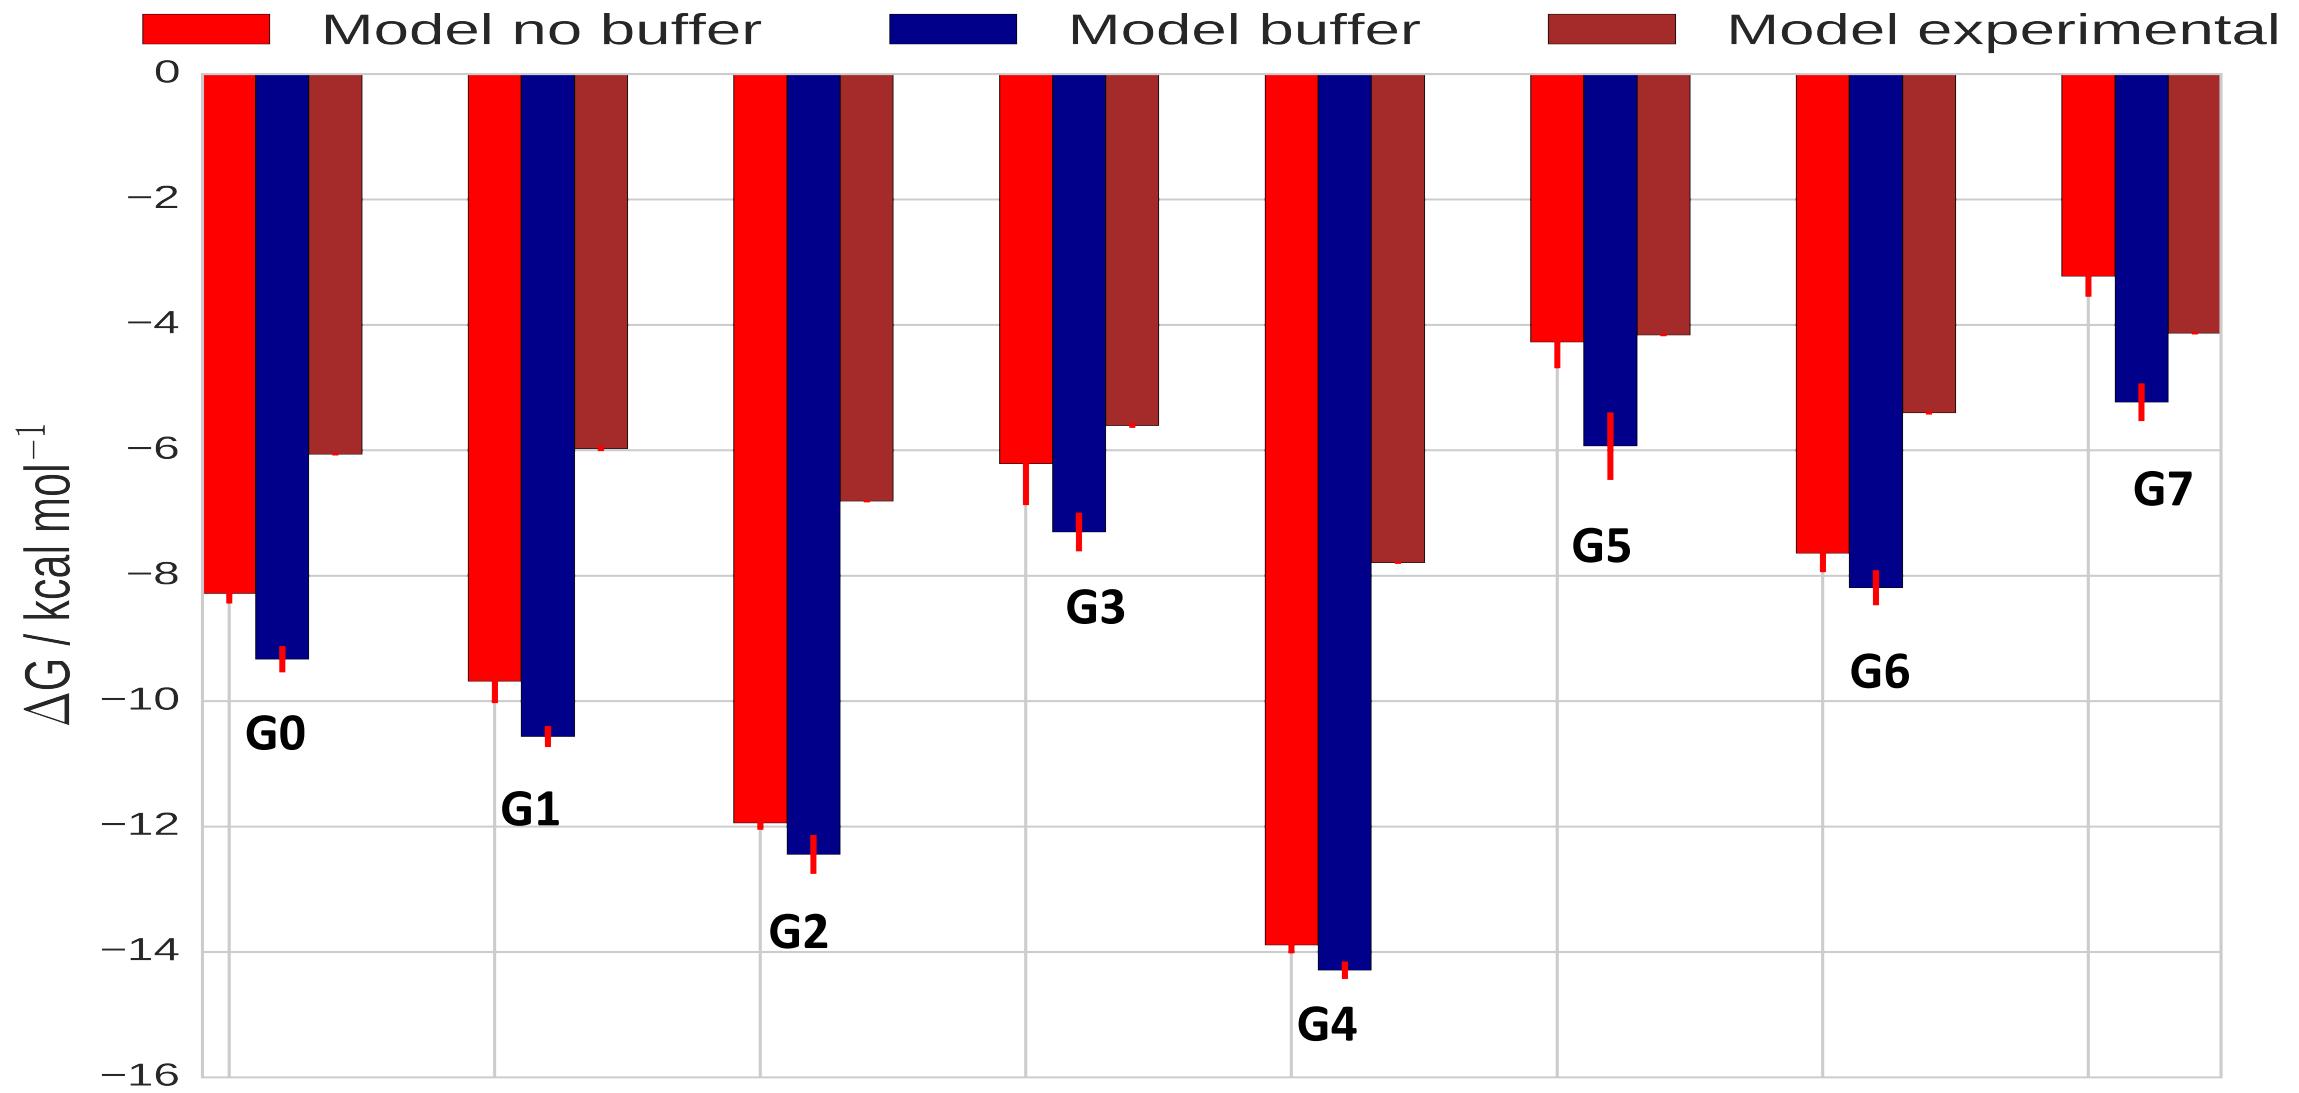

Results of TEMOA – Model D buffer

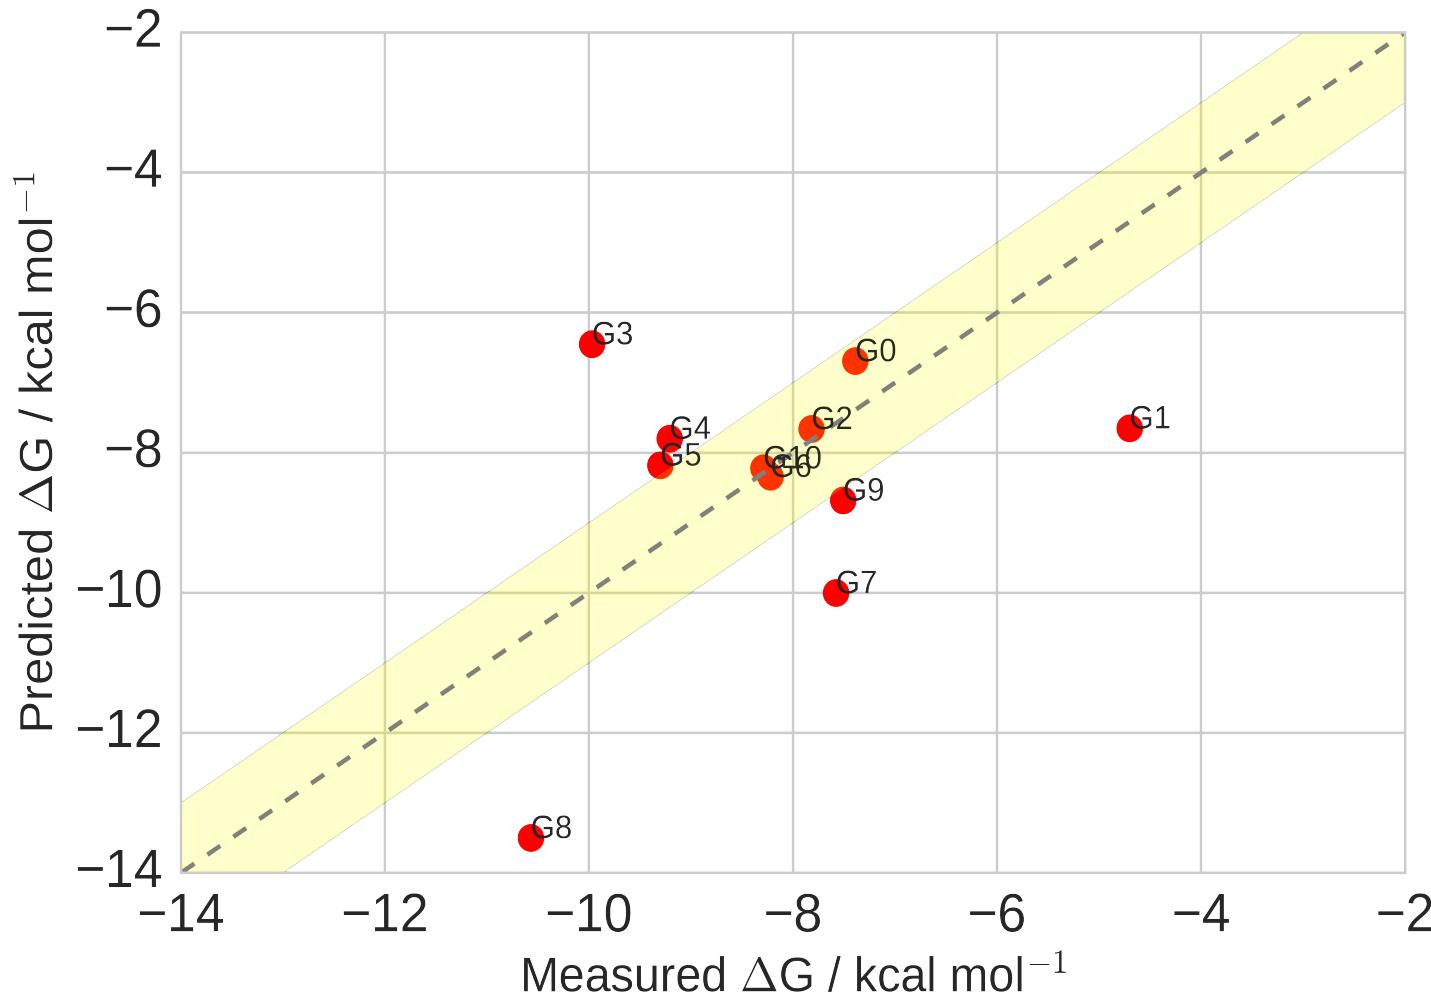

- Model D, **R²** : 0.89 < 0.93 < 0.96
MUE : 1.51 < 1.64 < 1.77 kcal/mol
Kendall tau : 0.79 < 0.85 < 0.86
- Model C, **R²** : 0.89 < 0.93 < 0.96
MUE: 3.23 < 3.42 < 3.59 kcal/mol
Kendall tau : 0.79 < 0.85 < 0.86
- Model A , **R²** : 0.89 < 0.93< 0.96
MUE: 5.48 < 5.66 < 5.85 kcal/mol
Kendall tau : 0.79 < 0.84 < 0.86
- **Buffer** did not improve the results

Comparison buffer-nobuffer in TEMOA host-guest systems-Model C

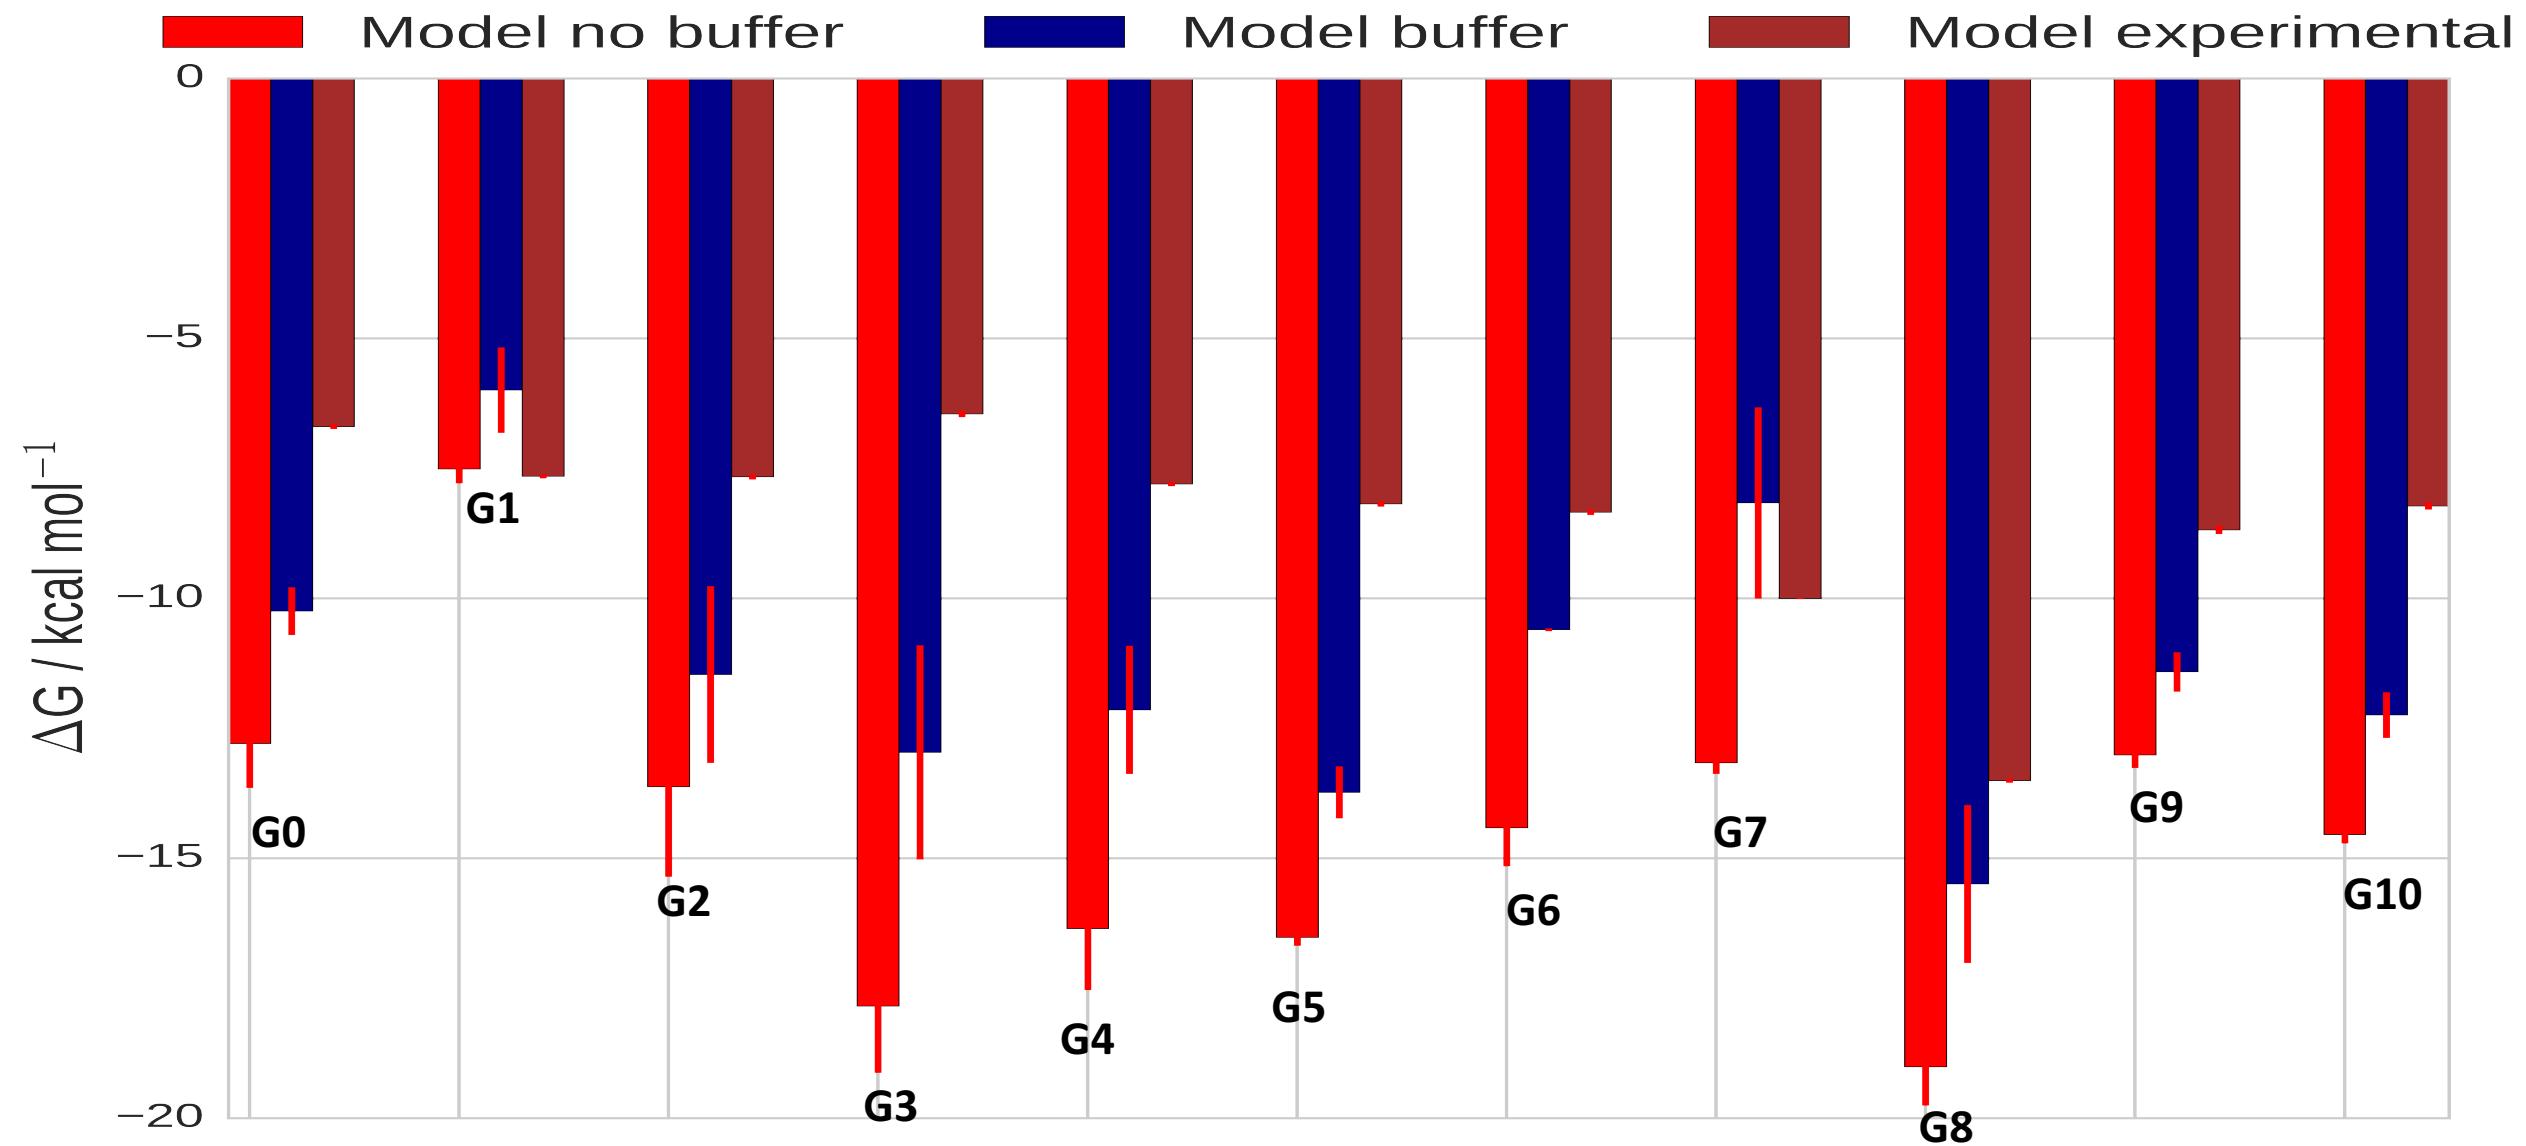

Results of CB8 – Model D no buffer

- Model D, $R^2 : 0.04 < 0.13 < 0.23$
MUE : $1.40 < 1.58 < 1.76$ kcal/mol
Kendall tau : $-0.09 < 0.05 < 0.20$
- Model C $R^2 : 0.04 < 0.13 < 0.23$
MUE: $5.57 < 6.00 < 6.43$ kcal/mol
Kendall tau : $-0.09 < 0.05 < 0.20$
- Model A , $R^2 : 0.04 < 0.13 < 0.23$
MUE: $6.90 < 7.33 < 7.75$ kcal/mol
Kendall tau : $-0.09 < 0.05 < 0.20$
- **Buffer** improved the results in Model C as it reduced the MUE by 3 kcal/mol

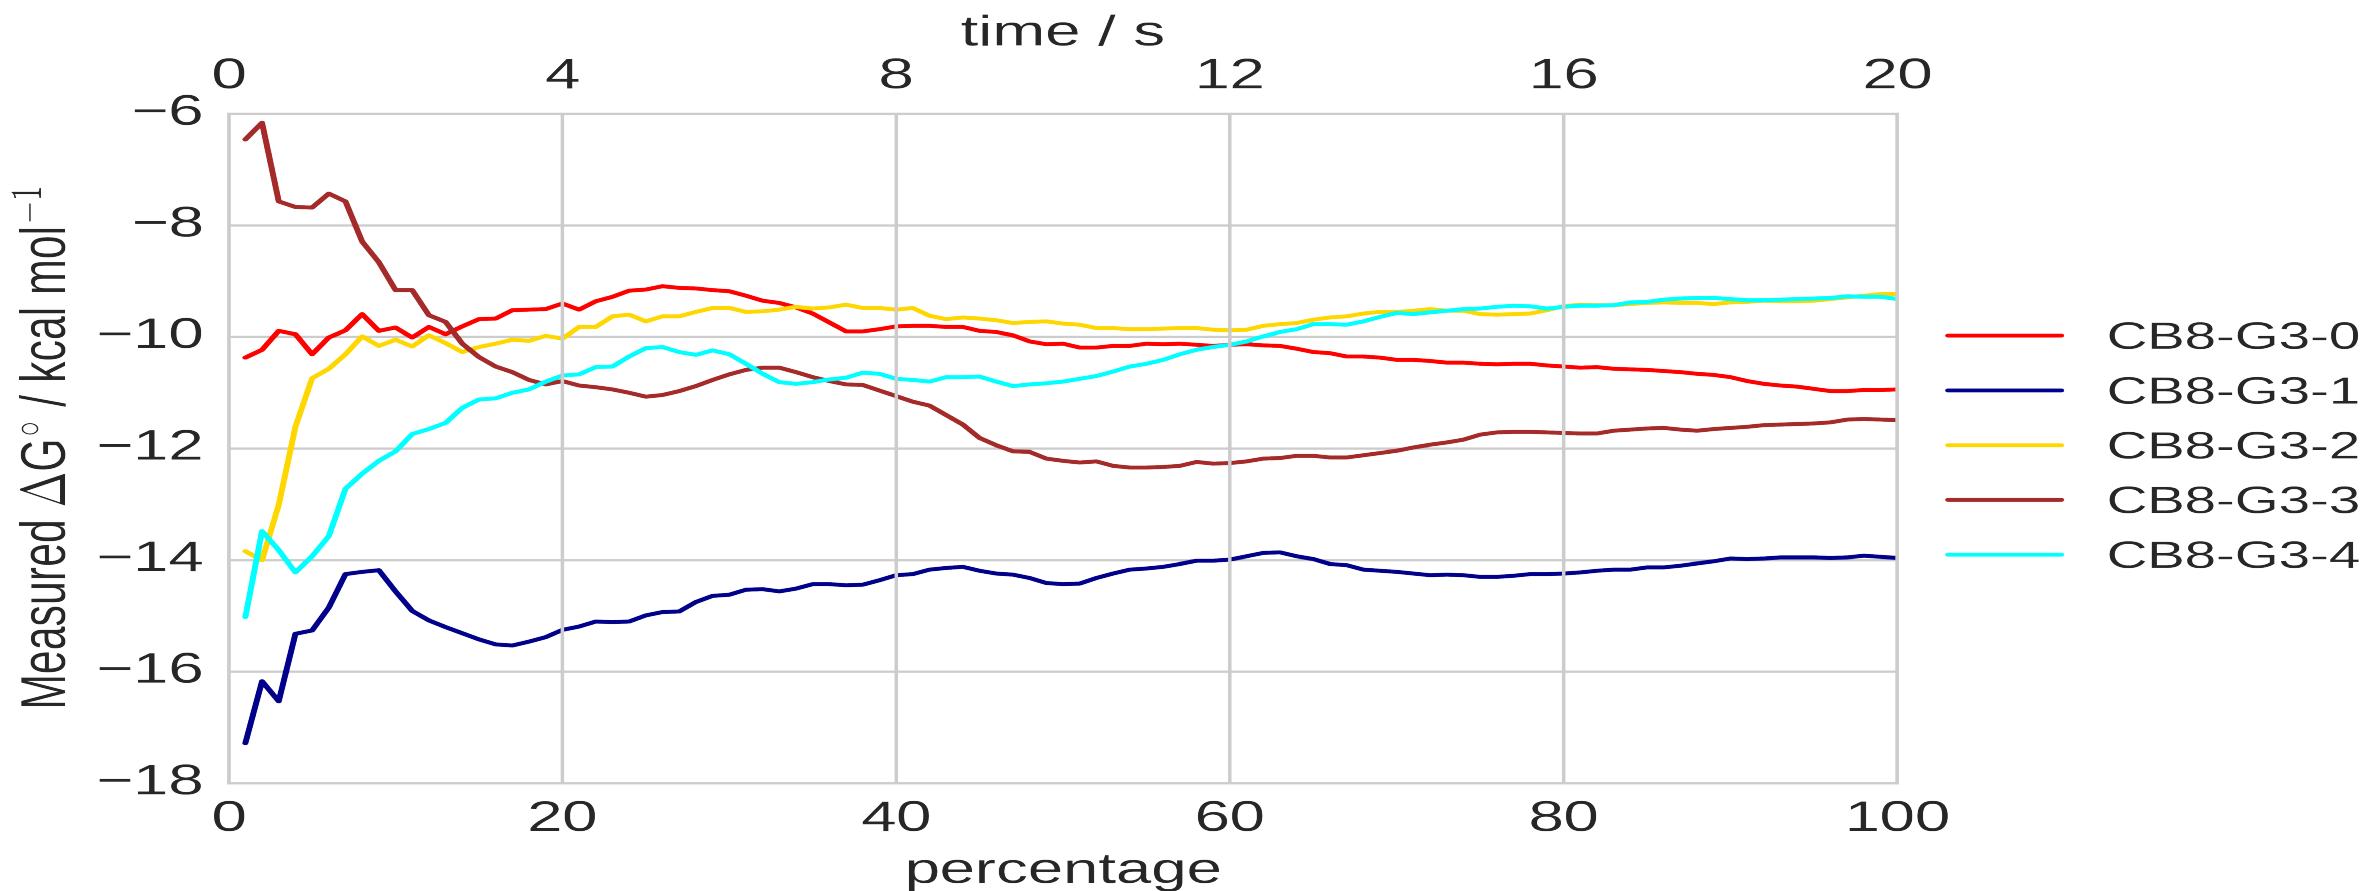

Comparison buffer-nobuffer in CB8 host-guest systems-Model C

SAMPLing results – CB8-G3

SAMPL6 Model C: $\Delta G_{Model\ C}^\circ = -12.96$ kcal/mol

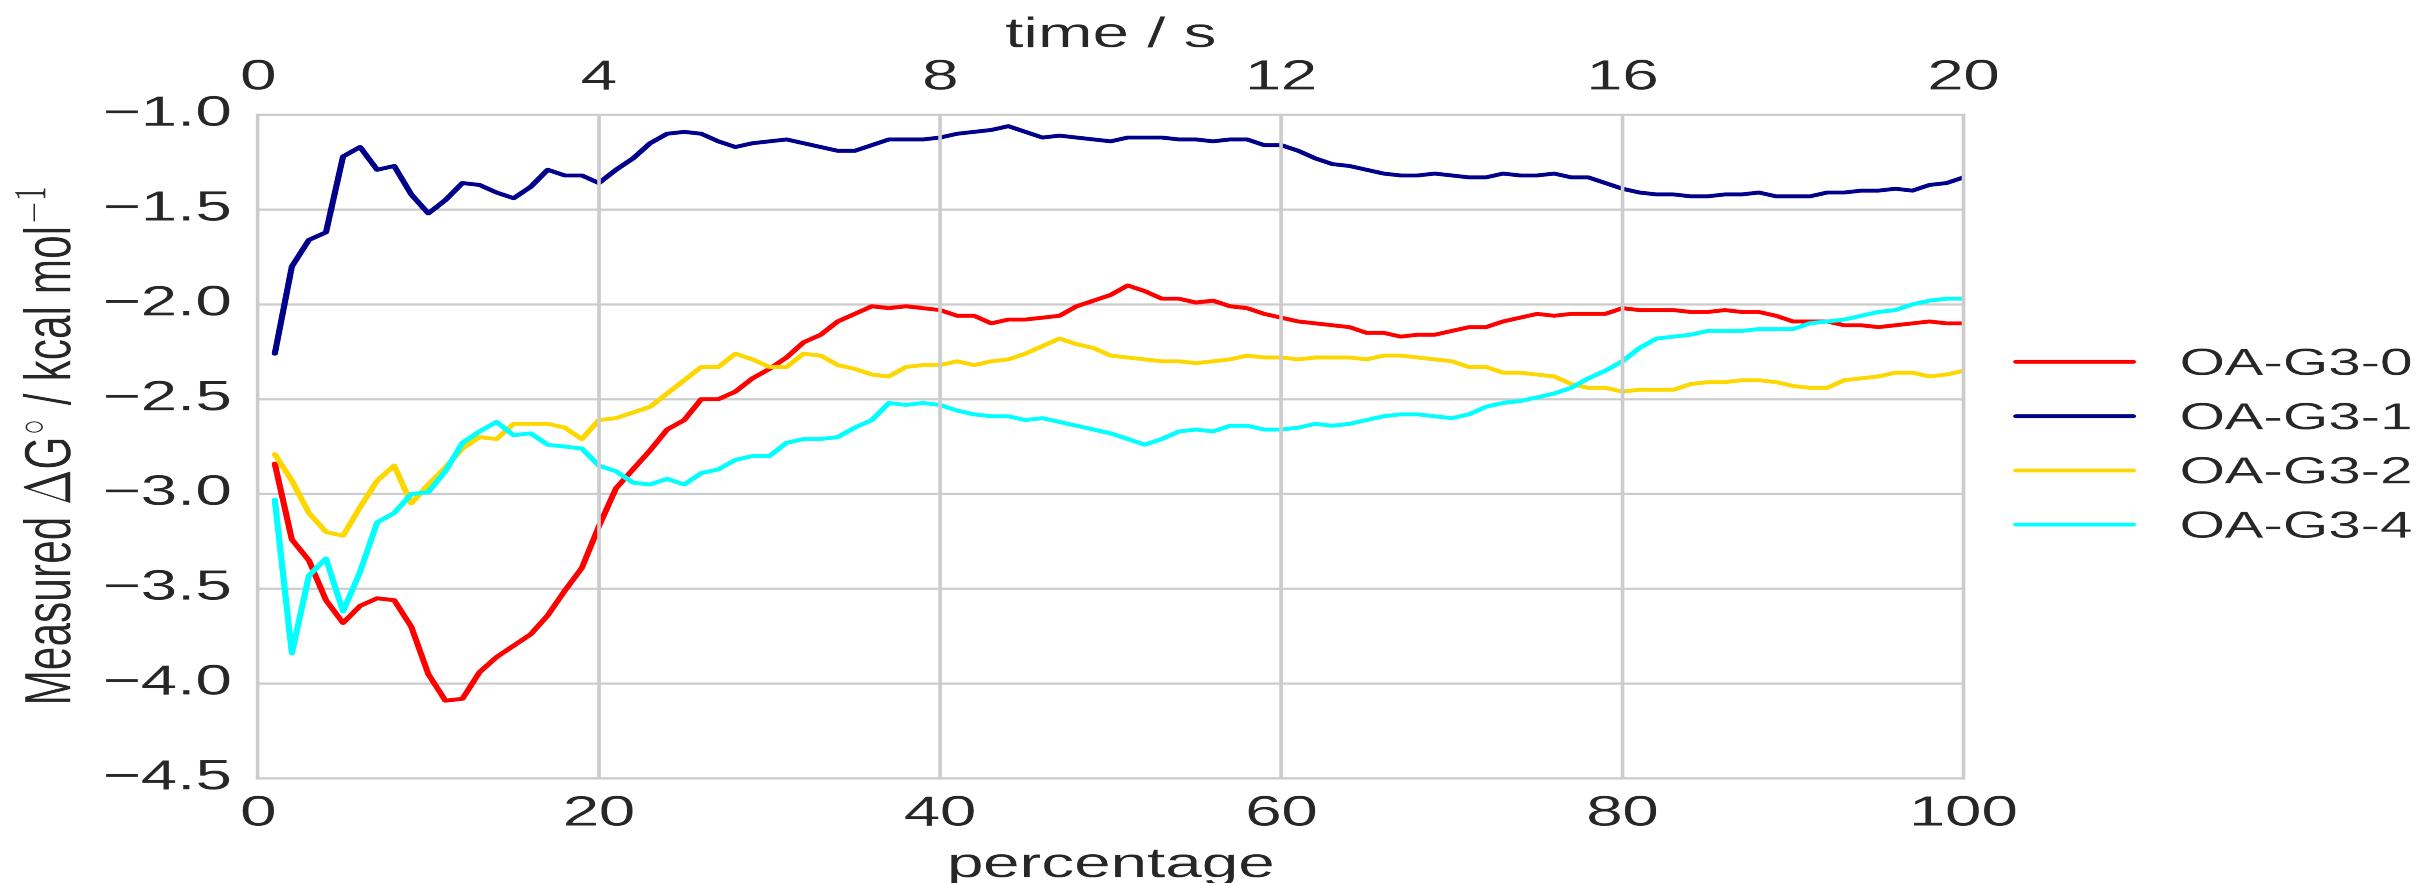

SAMPL6 experimental: $\Delta G_{experimental}^\circ = -6.45$ kcal/mol

SAMPLing results – OA-G3

SAMPL6 Model C: $\Delta G_{Model\ C}^\circ = -6.38 \text{ kcal/mol}$

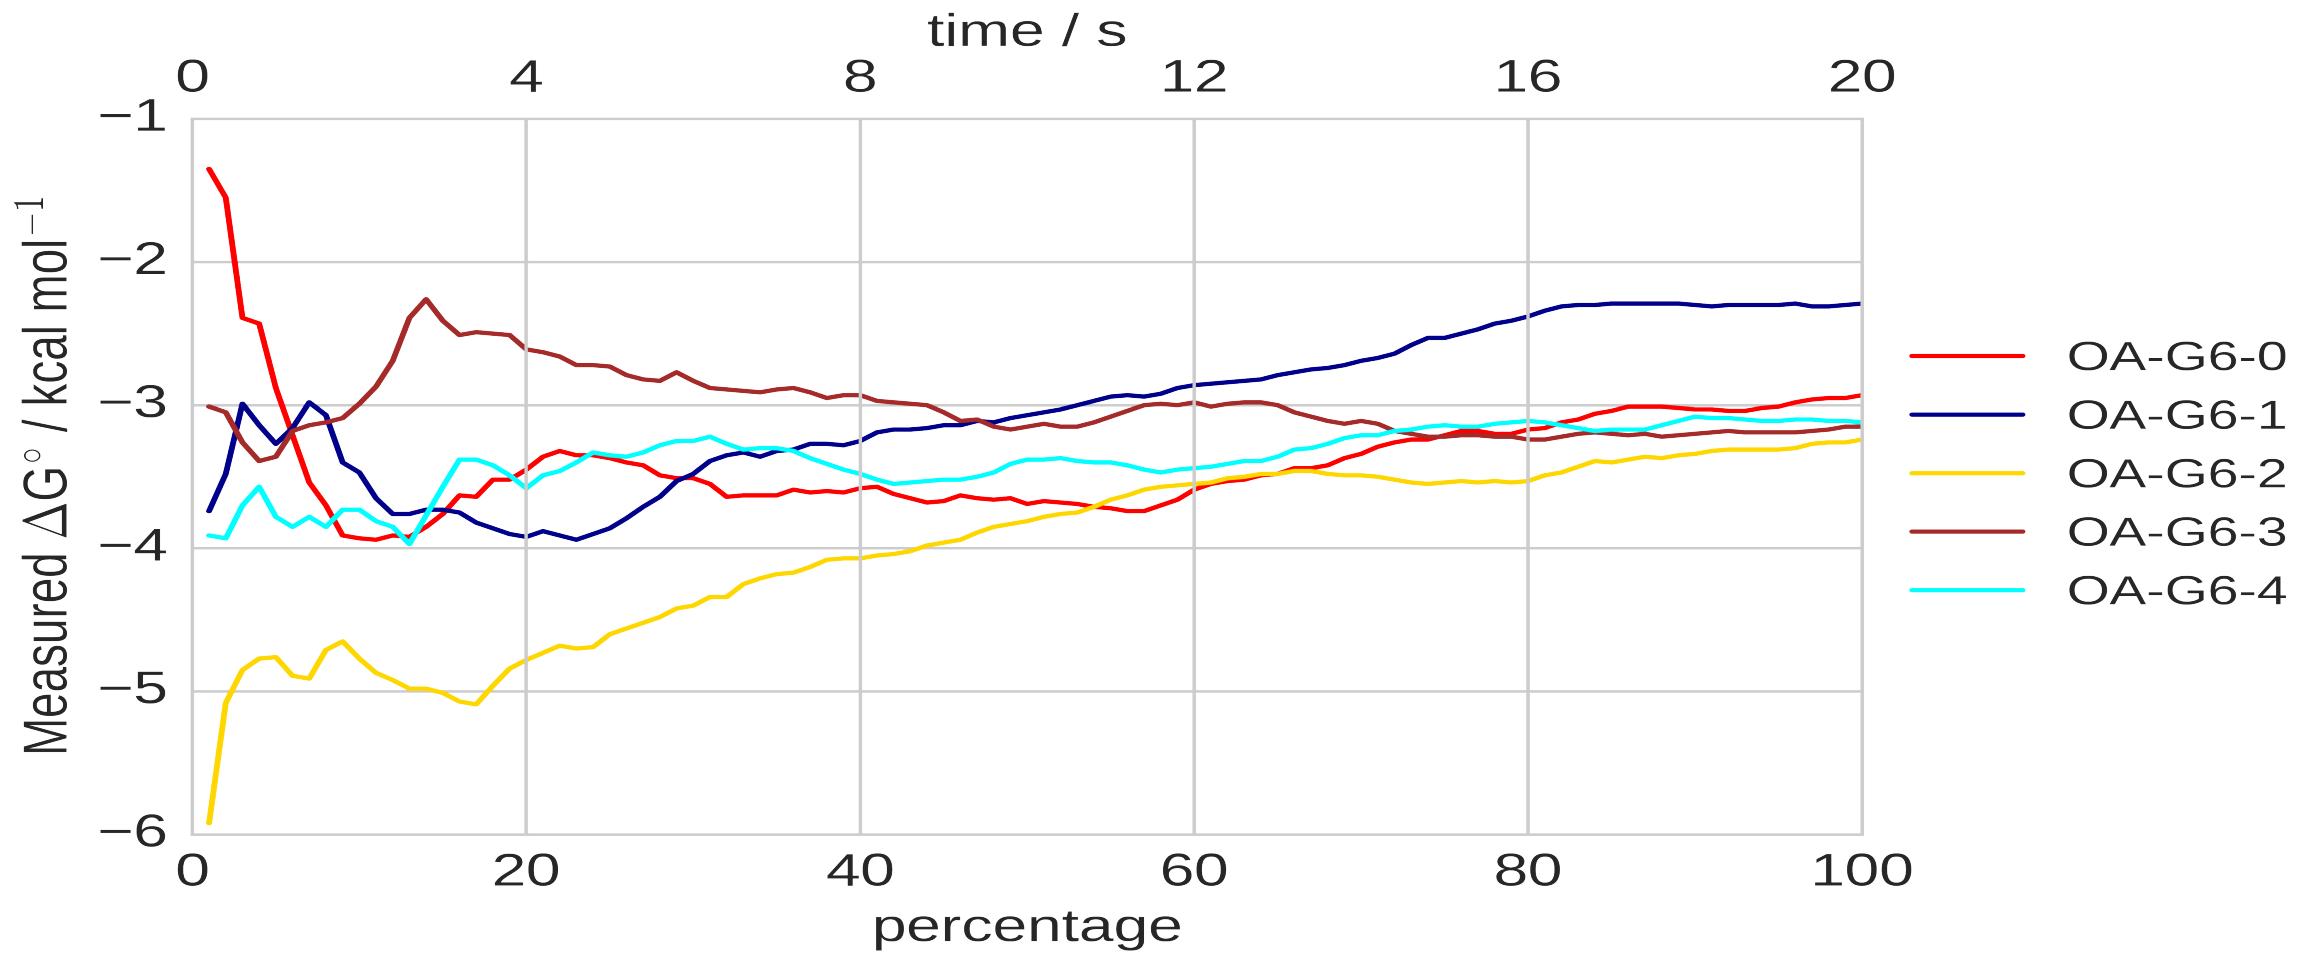

SAMPL6 experimental: $\Delta G_{experimental}^\circ = -5.18 \text{ kcal/mol}$

SAMPLing results – OA-G6

SAMPL6 Model C: $\Delta G_{Model\ C}^\circ = -8.08$ kcal/mol

SAMPL6 experimental: $\Delta G_{experimental}^\circ = -4.97$ kcal/mol

What lessons we have learned

1. Buffer did not improve the results for the OA and TEMOA host-guest systems but improved MUE in Model C for CB8 by 3 kcal/mol.
2. In general, Model C reduces the MUE but still overestimates the binding free energy and R^2 remains the same in comparison to Model A
3. Model D improved the prediction in terms of MUE but R^2 remains the same in comparison to Model C
4. In SAMPLing challenge – surprisingly no convergence in our results despite the length in our simulations and no agreement with our prediction in Model C of SAMPL6 and the experimental result

Supplementary info (1) - buffer

- Simulating the buffer in **OA** and **TEMOA** host-guest systems: We modelled the 10mM sodium phosphate buffer with NaCl by replicating the ionic strength. This results in 60mM of NaCl to mimic 10mM of Na₃PO₄, thus 4 Na and 4 Cl where added to each OA and TEMOA system. Initially buffer was added to the bound phase systems and the solvated guest files were created by substituting the host's heavy atoms with water molecules, to keep the same box size between both system files and the same NaCl concentration.
- Simulating the buffer in **CB8** host-guest systems: We modelled the 25mM sodium phosphate buffer with NaCl by replicating the ionic strength. This results in 150mM of NaCl to mimic 25mM of Na₃PO₄, thus 8 Na and 8 Cl where added to each CB8 system. Initially buffer was added to the bound phase systems and the solvated guest files were created by substituting the host's heavy atoms with water molecules, to keep the same box size between both system files and the same NaCl concentration.

Lennard Jones correction term

- The Lennard Jones dispersion correction term can be calculated from the Zwanzig relationship:

$$\Delta G_{LJLC}^X = k_B T \ln < \exp [-\beta (U_{LJ,long(r)} - U_{LJ,sim(r)})] >_X + U_{LJ,ana}$$

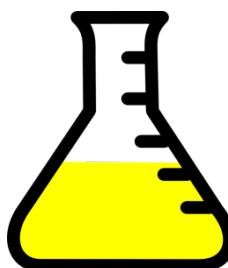

- An analytical correction over an infinite size box, $U_{LJ,ana}$ is needed, which is given below:

$$U_{LJ,ana} = 8\pi\rho \sum_i \sum_{j>i} \left[\frac{\varepsilon_{ij}\sigma_{ij}^{12}}{9r_c^9} - \frac{\varepsilon_{ij}\sigma_{ij}^6}{3r_c^3} \right]$$

Definition of a standard state

A computational vial with definite volume

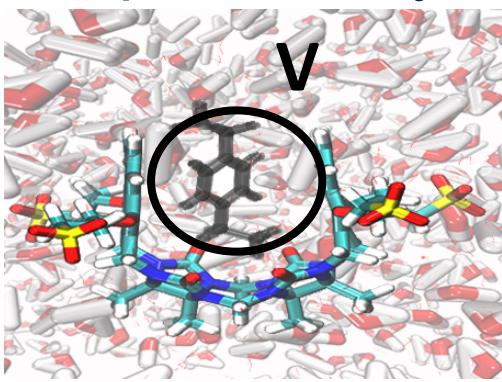

Experimentally: volume, pressure and concentration

At the equilibrium for the i-th species

$$\mu_{sol,i} = \mu_{sol,i}^0 + RT \ln \frac{\gamma_i C_i}{C^0} \quad \rightarrow \quad \Delta G_{AB}^0 = -RT \ln \left(\frac{\gamma_{AB}}{\gamma_A \gamma_B} \frac{C^0 C_{AB}}{C_A C_B} \right)$$

Computationally we already compute some terms but:

$$\Delta G_{std} = -RT \ln \frac{C}{C^0}$$

$$\Delta G_{std} = -RT \ln \frac{V}{1660 \frac{\text{\AA}^3}{\text{mol}}}$$
